7
8 I just picked up RPS Record Processing Services (a now-unsupported
9 Apple product, an extension of Pascal) from Sun Data, and was able to use it
10 to write a book indexing assistant program that had taken me about two weeks
11 in standard Pascal, and have it working in about four days! As far as I know,
12 the world's RPS expert is Terri Wiles (of CompuCraft, makers of PostMaster Mail
13 List Manager)... are there any contenders out there with experiences to share?
14 Anybody who has the source for it, so that we may continue to support it, in
15 Apple's absence?
16

17 For those unfamiliar with RPS, it provides an easy and fast means of
18 maintaining indexed data files keyed on practically any number of fields. It
19 operates as an extension of Pascal, and essentially maintains an index file
20 for each data file you use... which means that instead of the usual 10-12 file
21 limit (depending on how you direct output to printers, or whether you use a
22 program library file [If the program is PROGRAM.CODE, the library file is
23 PROGRAM.LIB, and takes up one of the available file slots]) you end up with
24 a maximum of 5-6 data files, meaning that you must create very large records,
25 and it is more difficult to attach "parallel" files to existing files, since
26 there is no "sequence" number to key from... but it also provides for the
27 file data space to be "paged" dynamically, and space is allocated based on
28 what is needed at the moment, instead of all declared file types being
29 allocated all the time, as is usually the case.
30

31 As I said, I've just started working with it... but Sun Data has it for
32 a very reasonable price, and if you're working with very large data files,
33 it will save you a lot of time, both in program development, and in file
34 access.
